5 Abstract of the Invention
6

7 A repository server system supports a user in submission of confidential
8 user information through client Web page forms served to user computer systems.
9 A data store contains user data referenceable by a first set of names. The
10 repository server processor is coupled to the data store and coupleable to a
11 communications network to receive a user data request from a user computer
12 system, where the user data request includes a client specification of the user data
13 requested to complete the client Web page form. The client specification identifies
14 user data by a second set of names. The processor provides for the conversion
15 of user data stored in correspondence with the first set of names to a form
16 corresponding with the second set of names.
